

ATP HYDRAULIK AG

Hydraulikmotoren
Serie 2000
Serie 2000 2-Speed
Serie 4000 Compact

B002-02 2006-04

Ein Produkt von **EAT•N**

Berechnungsformeln

Variablen

p = Druck in bar

n = Drehzahl in U/min

P = Leistung in kW

V = Schluckvolumen in cm³ / U

M = Drehmoment in Nm

Q_{eff} = Effektives Schluckvolumen in l/min

Q_{theo} = Theoretisches Schluckvolumen in l/min

η_v = Volumetrischer Wirkungsgrad in %
Wirkungsgrad

η_{hm} = Hydraulisch-mechanischer

η_t = Gesamtwirkungsgrad in %

Theoretisches Schluckvolumen

$$Q_{theo} = n \cdot V \cdot 10^{-3}$$

Schluckvolumen

$$Q_{eff} = \frac{n \cdot V}{\eta_v} \cdot 10^{-1}$$

Zulaufdruck

$$p = \frac{M \cdot 10^4}{V \cdot \eta_{hm} \cdot 1.59}$$

Abtriebsleistung

$$P = \frac{p \cdot Q_{eff} \cdot \eta_t}{6} \cdot 10^{-4}$$

Abtriebsmoment

$$M = p \cdot V \cdot \eta_{hm} \cdot 1.59 \cdot 10^{-4}$$

Produkteschlüssel

Übersicht

| | | |
|--|---|--|
| <p>Serie 2000</p> <p>Geroler Element</p> <p>Schluckstrom 75 l/min. kontinuierlich 115 l/min. intermittierend</p> <p>Drehzahl bis 1042 1/min.</p> <p>Druckdifferenz 200 bar kontinuierlich 300 bar intermittierend</p> <p>Drehmoment 845 Nm kontinuierlich 930 Nm intermittierend</p> | <p>Die populäre 2000 Reihe ermöglicht Drehmomente bis 845 Nm. Dieses bewährte Design ist zuverlässig und langlebig. Eaton hat die Optionen erweitert, die den Motor für eine Vielzahl von Anwendungen flexibler macht. Das eingebaute Doppeldruckbegrenzungsventil ist die neueste Innovation bei den 2000er Motoren.</p> | |
| <p>Serie 2000 2-Speed</p> <p>Geroler Element</p> <p>Schluckstrom 57 l/min kontinuierlich 76 l/min intermittierend</p> <p>Drehzahl bis 1020 1/min</p> <p>Druckdifferenz 155 bar kontinuierlich 190 bar intermittierend</p> <p>Drehmoment 430 Nm kontinuierlich 486 Nm intermittierend</p> | <p>Die Eaton-Motoren der Serie 2000 und 10000 sind verfügbar mit einem im Verhältnis 1:2 umschaltbaren Schluckvolumen. Die Umschaltung zwischen maximaler (LSHT-Modus) und minimaler Verdrängung (HSLT-Modus) erfolgt mittels eines integrierten druckbetätigten 3/2 - Wegeventils. Der minimale Steuerdruck beträgt 7 bar plus Gehäusedruck. Bei halber Verdrängung werden ca. 50% des Drehmomentes sowie die doppelte Drehzahl bezogen auf die maximale Verdrängung erzielt.</p> | |
| <p>Serie 4000 Compact</p> <p>Geroler Element</p> <p>Schluckstrom 75 l/min kontinuierlich 115 l/min intermittierend</p> <p>Drehzahl bis 699 1/min.</p> <p>Druckdifferenz 200 bar kontinuierlich 300 bar intermittierend</p> <p>Drehmoment 975 Nm kontinuierlich 1218 Nm intermittierend</p> | <p>Diese neue kompakte Baureihe, die zur Familie der Disc-Valve Hydraulik Motoren gehört, produziert die gleichen Drehmomentwerte wie die aktuelle 4000er Serie. Jedoch ist das Gehäuse ähnlich wie die kleinere 2000 Serie. Das maximale Drehmoment (intermittierend) beträgt 1220 Nm. Die Vielzahl der Montage-möglichkeiten umfasst 2-Loch-flansche (SAE A, SAE B) und 4-Loch-flansche (Magneto, Standard und Rad-Motor)</p> <p>Für mehr Flexibilität kann der Motor sowohl mit den grösseren Wellen aus der 2000er Serie, den Standartwellen aus der 4000er Serie und der neuen, zylindrischen 1-1/2" Welle bestückt werden. (das kleine Gehäuse und die freie Wahl der Wellen machen diesen Motor ideal für Fahrzeuge wie Lader und Stapler deren Funktion hohe Energie und Produktivität auf engstem Raum ist.)</p> | |

Leistungsdaten Serie 2000

Die Motoren laufen in allen für sie vorgesehenen Drehzahl- und Drehmomentbereichen mit einem hohen Wirkungsgrad. Zum Erreichen einer maximalen Lebensdauer ist es jedoch wichtig, dass die Auswahl für Drehmoment und Drehzahl aus dem hellgrauen Bereich getroffen wird.

Die Leistungen gelten für eine Öl-Viskosität von 25cSt. Die tatsächlichen Daten können von Motor zu Motor geringfügig variieren.

Leistungsdaten Serie 2000 2-Speed

Die Motoren laufen in allen für sie vorgesehenen Drehzahl- und Drehmomentbereichen mit einem hohen Wirkungsgrad. Zum Erreichen einer maximalen Lebensdauer ist es jedoch wichtig, dass die Auswahl für Drehmoment und Drehzahl aus dem hellgrauen Bereich getroffen wird.

Die Leistungen gelten für eine Öl-Viskosität von 25cSt. Die tatsächlichen Daten können von Motor zu Motor geringfügig variieren.

Die Angaben in den Tabellen beziehen sich auf LSHT (Langsame Drehzahl, hohes Drehmoment). Wird der Motor auf HSLT (Schnelle Drehzahl, kleineres Drehmoment) betrieben, halbieren sich das Schluckvolumen pro Umdrehung und das Drehmoment. Die Drehzahl verdoppelt sich.

Beispiel: Werte aus der Tabelle für 80 cm³ pro Umdrehung für 70 bar Druck und 23 Liter pro Minute Volumenstrom

LHST = 80 cm³ /Umdr., 75Nm Drehmoment, 267 Umdrehungen pro Minute
 HSLT = 40 cm³ /Umdr., 37.5 Nm Drehmoment, 534 Umdrehungen pro Minute

Antriebswelle

00 Ohne (Kugellagerlos)

01 1" zylindrisch mit Scheibenfeder und Gewindebohrung 1/4-20 UNC

02 1 1/4" zylindrisch mit Keil und Gewindebohrung 3/8-16 UNC

03 1 1/4" konisch SAE J501 mit Passfeder und Gewinde 1-20" UNEF

04 1 1/4" Vielkeilwelle ANSI B92.1 1976 14T mit Gewindebohrung 3/8-16 UNC

05 1" Vielkeilwelle SAE J499 mit Gewindebohrung 1/4-20 UNC

07 7/8" Vielkeilwelle SAE J498b

08 1" Vielkeilwelle 16/32 SAE BB ANSI B92.1 1976 15T

23 32mm zylindrisch mit Keil und Gewindebohrung M8 x 1.25 -6H

26 25mm zylindrisch mit Keil und Gewindebohrung M8 x 1.25 -6H

9

Anschlüsse

A 7/8-14 UNF-2B O-Ring Anschluss , 9/16-18 UNF-2B (optional 7/16-20 UNF-2B) O-Ring Leckanschluss und 7/16-20 UNF-2B O-Ring Steueranschluss

B G 1/2 Anschluss , 2 x G 1/4 Leckanschluss und G 1/4 Steueranschluss

C 7/8-14 UNF-2B O-Ring Anschluss , 9/16-18 UNF-2B und 7/16-20 UNF-2B O-Ring Leckanschluss 7/16-20 UNF-2B O-Ring Steueranschluss

D 7/8-14 UNF-2B O-Ring Anschluss , 9/16-18 UNF-2B (optional 7/16-20 UNF-2B) O-Ring Leckanschluss

10

Spül- mit Spüldruckventil

0 Ohne

1 Spül- mit Spüldruckventil bei 10.3 bar

2 Spül- mit Spüldruckventil bei 4.1 bar

11

2-Speed Ventilstellung

A Grundstellung Schnelllauf

B Grundstellung Langsamlauf

C Steuerdruckbetätigt beidseitig(NICHT ERHÄLTLICH)

D manuell betätigt 1/4-20 UNC-2B Anschluss

12 13

Sonderausstattung

00 Ohne

01 Flansch um 90° gedreht

02 Rückwärtlauf, Viton Dichtungen

03 Rückwärtlauf

04 Long Body digital speed pickup (30 pulse) 127mm Anschlusskabel mit geschütztem Stecker Belegung (A = Power, B =Signal, C = Common)

05 Viton Dichtungen

06 Rückwärtlauf, Viton Dichtungen

07 Freilauf Geroler

08 Long Body digital speed pickup (30 pulse) 127mm Anschlusskabel mit geschütztem Stecker Belegung (A = Power, B =Signal, C = Common) Kundenspezifische Ausführung

09 Wellendichtungsschutz

10 Leckreduzierter Geroler

14

Farbe / Oberflächen-Behandlung

0 Unlackiert

A Schwarz matt

Manuelle Ventilverstellung Serie 2000 2-Speed

Die Position 11 im Modelcode bezeichnet die Art, wie zwischen den zwei Geschwindigkeitsstufen umgeschaltet wird. Die Option „D“ wird manuell geschaltet.

Der Betätigungskolben macht dabei eine lineare Bewegung von 13.7mm.

Leistungsdaten Serie 4000 Compact

Die Motoren laufen in allen für sie vorgesehenen Drehzahl- und Drehmomentbereichen mit einem hohen Wirkungsgrad. Zum Erreichen einer maximalen Lebensdauer ist es jedoch wichtig, dass die Auswahl für Drehmoment und Drehzahl aus dem hellgrauen Bereich getroffen wird.

Die Leistungen gelten für eine Öl-Viskosität von 25cSt. Die tatsächlichen Daten können von Motor zu Motor geringfügig variieren.

Montageflansch

AB 4-Loch Wheel; Zentrierung 108 x 6mm Lochkreis 147.6mm mit Durchmesser 13.59mm

AC 2-Loch SAE A; Zentrierung 82.5 x 6.4mm Lochkreis 106.35mm mit Durchmesser 13.59mm

AE 4-Loch Kugellagerlos; Zentrierung 101.6 x 6mm Lochkreis 127mm mit Durchmesser 13.59mm

AF 2-Loch SAE B; Zentrierung 101.6 x 6mm Lochkreis 146mm mit Durchmesser 14.35mm

AH 4-Loch; Zentrierung 82.5 x 6.4mm Lochkreis 106.4mm mit Durchmesser 13.59mm

AJ 4-Loch Magneto; Zentrierung 82.5 x 2.3mm Lochkreis 106.4mm mit Durchmesser 13.59mm

AP 4-Loch Wheel-comp für Hayes-Bremse; Zentrierung 107.9 x 2.8mm Lochkreis 147.6mm mit Durchmesser 13.59mm

Folgende Flansche sind nur in Verbindung mit Antriebswelle 08, 11, 98, 99 möglich:

BB 4-Loch ähnlich wie SAE B Zentrierung 101.6 x 10.0mm Lochkreis 127.0mm mit Durchmesser 14.7mm

BE 4-Loch-Wheel; Zentrierung (vorne / hinten 139.7 x 8.6mm / 7.9mm) Lochkreis 165.1mm mit Durchmesser 13.59mm

BG 4-Loch-Wheel kurz; Zentrierung (vorne / hinten 139.7 x 8.6mm / 7.9mm) Lochkreis 165.1mm mit Durchmesser 13.59mm

8 9

Antriebswelle

00 Ohne (Kugellagerlos)

02 1 1/4" zylindrisch mit Keil und Gewindebohrung 3/8-16 UNC

03 1 1/4" konisch SAE J501 mit Passfeder und Gewinde 1-20" UNEF

Technische Zusatzinformationen

Hochdruckwellendichtring

Diese erprobte Hochdruckwellendichtung besitzt eine patentierte Dichtlippe, die bei hohen Radialkräften entsprechend der Wellendurchbiegung nachgibt und hierdurch ein besseres Dichtungsverhalten erzeugt. Außerdem halten diese Dichtringe einem Rücklaufdruck stand von bis zu 140 bar [2000 PSI] bei Serie 2000 und 100 bar [1500 PSI] bei Serie 4000.

Korrosionsschutz

Motoren der Serie 2000, 4000, 6000 und 10000 sind mit einer korrosionsbeständigen Beschichtung für den Einsatz unter rauen Arbeitsbedingungen, wie z.B. Salz, Wasser und verschiedene Chemikalien erhältlich. Diese Beschichtung bewährt sich speziell in den Bereichen Seefahrt, Nahrungsmittel- und Fischereiindustrie, in Autowaschanlagen sowie in der Landwirtschaft. Durch die Beschichtung der Welle werden Dichtungsschäden durch ätzende und säurehaltige Stoffe eliminiert. Der Korrosionsschutz der Motoren ist in zwei Ausführungen erhältlich: nur mit einer korrosionsgeschützten Abtriebswelle oder zusätzlich mit einer Beschichtung des gesamten Motors.

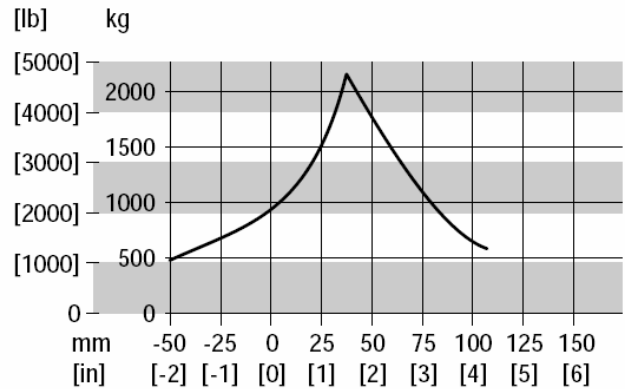

Wellenbelastung Serie 2000 / 2000 2-Speed

Die Diagramme auf dieser Seite zeigen die zulässigen Radialkräfte auf die Abtriebswelle(n) bezogen auf verschiedene Kraftangriffspunkte.

Das Diagramm basiert auf einer Lagerlebensdauer L 10 (2000 Stunden oder 12.000.000 Wellenumdrehung bei 100 1/min) bei Nenn Drehmoment. Zur Ermittlung der Radialkräfte bei anderen Drehzahlen als 100 1/min sind die im Lagerdiagramm angegebenen Belastungswerte mit den in nachstehender Tabelle aufgeführten Faktoren zu multiplizieren.

| 1/min | Multiplikationsfaktor |
|-------|-----------------------|
| 50 | 1.23 |
| 100 | 1.00 |
| 200 | .81 |
| 300 | .72 |
| 400 | .66 |
| 500 | .62 |
| 600 | .58 |
| 700 | .56 |
| 800 | .54 |

Bei 3.000.000 Wellenumdrehungen oder 500 Stunden erhöhen sich diese Wellenbelastungen um 52 %.

Wellenbelastung Serie 4000 Compact

Die Diagramme auf dieser Seite zeigen die zulässigen Radialkräfte auf die Abtriebswelle(n) bezogen auf verschiedene Kraftangriffspunkte. Das Diagramm basiert auf einer Lagerlebensdauer L 10 (2000 Stunden oder 12.000.000 Wellenumdrehung bei 100 1/min) bei Nenndrehmoment. Gehäusedruck und Leckölabführung

Viele Hydrauliksysteme können von einer Leckölabführung profitieren. Auch Char-Lynn-Motoren bieten die Möglichkeit einer externen Leckölabführung. Eine separate Leckölabführung hat u. a. folgenden Vorteil: Verunreinigungen werden aus dem System herausgespült. Die Gehäuseespülung trägt auch zur Kühlung des Systems und zur Verringerung des Gehäusedrucks bei, wodurch die Lebensdauer der Motordichtung verlängert wird. Bei angeschlossener Leckölleitung kann auch der Druck in angebauten Getrieben (Anwendungen mit Bearingless Motoren) kontrolliert werden. Für Systemanwendungen mit erhöhtem Kühl- und Spülbedarf ist bei Motoren der Serie 2000 und 4000 ein Spülventil als Sonderausstattung lieferbar.

Maximaler Gehäusedruck

Serie 2000 / 2000 2-Speed für alle Model-Code Wellennummern

Serie 4000 Compact für Model-Code Wellennummern 02, 03, 06

Serie 4000 Compact für Model-Code Wellennummern 08, 10, 11, 98, 99

Drehzahl-Sensor

Eaton hat einen Drehzahlsensor speziell für langsam laufende Hochmomentmotoren entwickelt. Es handelt sich um eine robuste Ausführung, die vollständig gegen Falschpolung oder Kurzschluss gesichert ist. Ein innenliegender Lastwiderstand erleichtert die Einbindung in elektronische Überwachungssysteme.

Der Sensor ist vollständig kompatibel zu allen elektrischen Systemen des Fahrzeugbaus und ermöglicht ein zuverlässiges digitales EIN/AUS-Signal innerhalb großer Drehzahl und Temperaturbereiche. Der Drehzahlsensor kann vor Ort gewartet werden; es ist keine Einstellung im Werk und kein Justieren erforderlich.

Eingangsspannung: 8 bis 24 V (kompatibel zu 12V-Systemen)

Eingangsstromstärke: 20 mA max. (einschl. internem Widerstand)

Ausgangsspannung: Kleiner als $< .5 \text{ V @ } 10 \text{ mA}$; offener Kollektor mit $10\text{k}\Omega$ Widerstand

Anschlüsse: 3-polig ,Weatherpack Connector mit US Verkabelung 18 AWG:

Position A (rot) = Eingangssignal

Position B (weiß) = Ausgangssignal

Position C (schwarz) = Masse

Ausgang: Digitales EIN/AUS-Signal vom Hall-Effekt-Schalter; 30 Impulse pro Umdrehung

Empfehlungen für Druckflüssigkeiten

Einführung

Das Leistungsverhalten und die Lebensdauererwartung von Eaton Hydraulik-Komponenten hängen weitgehend von der Verwendung der Druckflüssigkeit ab. Dieser Abschnitt soll dem Leser das Wissen vermitteln, das notwendig ist zur Auswahl der geeigneten Druckflüssigkeiten in Systemen mit Eaton Hydraulik-Komponenten. Eines der wichtigsten Auswahlkriterien für Druckflüssigkeiten in Hydraulik-Systemen ist die Viskosität. Die Wahl der Viskosität stellt immer einen Kompromiss dar; die Druckflüssigkeit muss dünnflüssig genug sein um einen leichten Durchfluss zu erreichen und dickflüssig genug, um abzudichten und einen Schmierfilm zwischen Lager und Dichtflächen zu gewährleisten. Viskositätsanforderungen sind unten aufgeführt.

Viskosität und Temperatur

Die Temperatur der Druckflüssigkeit beeinflusst die Viskosität. Allgemein gilt, dass bei steigenden Temperaturen die Druckflüssigkeit dünner wird und ihre Viskosität abnimmt. Das gegenteilige Verhalten trifft bei kalten Druckflüssigkeiten zu. Bei der Auswahl von Druckflüssigkeiten ist es wichtig, die Anfahr- und Betriebstemperatur des Hydrauliksystems zu berücksichtigen. Allgemein gilt, dass die Druckflüssigkeit dickflüssig ist, wenn das Hydrauliksystem angefahren wird.

Im weiteren Einsatz steigt die Temperatur der Druckflüssigkeit bis zu einem Punkt, an dem ein Kühlsystem zugeschaltet wird. Von da an behält die Druckflüssigkeit die Temperatur bei, für die das Hydrauliksystem ausgelegt ist. Für bestehende Anwendungen kann die Zeitfolge unterschiedlich sein, weil hydraulische Systeme in vielen Umgebungen angewandt werden, die von sehr kalt bis sehr heiß reichen. Kühlsysteme können ebenfalls variieren von sehr hoch entwickelt bis sehr einfach, so dass die Umgebungstemperatur die Einsatztemperatur beeinflussen kann.

Erstausrüster, die Eaton Hydraulik-Komponenten einsetzen, sollten Einsatztemperaturen in ihrer Systemauslegung einbeziehen und ihren Kunden die entsprechenden Empfehlungen für die Auswahl einer Druckflüssigkeit verfügbar machen.

Reinheitsklasse

Die Reinheit der Druckflüssigkeit in einem Hydrauliksystem ist äußerst wichtig. Eaton empfiehlt, dass die Druckflüssigkeit in ihren Hydraulik-Komponenten entsprechend SAE J1165 einen ISO-Reinheitsgrad nach Code 18/13 beibehält. Dieser Code erlaubt ein Maximum von 2500

Schmutzteilchen pro Milliliter größer als 5 μm und ein Maximum von 80 Schmutzteilchen pro Milliliter größer als 15 μm . Wenn Komponenten unterschiedlicher Reinheitsanforderungen im gleichen System eingesetzt werden, trifft der höhere Reinheitsgrad zu. Erstausrüster und Händler, die Eaton-Komponenten in ihren Produkten verwenden, sollten diese Anforderungen in ihrem Systementwurf berücksichtigen. Ein allgemein anerkannter Filter-Lieferant kann die entsprechenden Filter-Informationen zur Verfügung stellen.

Überprüfung der Druckflüssigkeit

Die Einhaltung der korrekten Viskosität und des Reinheitsgrades einer Druckflüssigkeit ist wichtig in allen Hydrauliksystemen. Da Eaton Hydraulik-Komponenten in einem breiten Fächer von Anwendungsarten eingesetzt werden, ist es für Eaton nicht möglich, einen Öl-Wartungsplan zu erstellen, der jede Situation berücksichtigt. Feldversuche und eine ständige Überwachung sind die einzigen Möglichkeiten, um genaue Messungen der Systemreinheit zu erzielen. Erstausrüster und Händler, die Eaton Produkte verwenden, sollten Tests durchführen und Service-Intervalle für ihre Produkte festlegen. Diese Wartungspläne sollten so bemessen sein, dass die Viskositäts- und Reinheitsanforderungen aus diesem Dokument berücksichtigt werden.

Auswahl der Druckflüssigkeit

Hydraulik-Flüssigkeiten auf der Basis von erstklassigem Mineralöl garantieren die besten Leistungen in Eaton Hydraulik-Komponenten. Diese Öle enthalten spezielle Additive, die für Hydrauliksysteme nützlich sind. Eaton empfiehlt Druckflüssigkeiten, die Stoffe gegen Verschleiß, Rost, Schäumung und Oxydation enthalten. Druckflüssigkeiten auf Mineralölbasis tragen eine VG Kennzeichnung nach ISO.

SAE Motoröle können in Systemen mit Eaton Hydraulik-Komponenten verwendet werden, es sollte aber berücksichtigt werden, dass diese Öle unter Umständen nicht alle empfohlenen Additive enthalten. Die Verwendung von Motorölen kann demnach die Service-Intervalle erhöhen.

Hydraulik-Flüssigkeiten mit sog. V.I. (Viskositätsindex) Verbesserungsmitteln, manchmal auch als Multi-Viskositätsöle bezeichnet, können in Systemen mit Eaton Hydraulik-Komponenten verwendet werden. Diese V.I. verbessernden Druckflüssigkeiten verlieren bei ständigem Gebrauch schneller ihre ursprüngliche Qualität, d.h. die Viskosität fällt unter den klassifizierten Wert.

Die Service-Intervalle müssen bei Verwendung von V.I. verbesserten Druckflüssigkeiten erhöht werden.

Synthetische Druckflüssigkeiten können in Eaton Hydraulik-Komponenten verwendet werden. Ein anerkannter Öl-Lieferant kann Informationen über synthetische Druckflüssigkeiten verfügbar machen. Anwendungen, die die Verwendung von synthetischen Druckflüssigkeiten erforderlich machen, sind mit unserer Technischen Abteilung abzusprechen

| | Viskosität | | ISO Reinheitsanforderung |
|--|--------------------------|----------------------------------|--------------------------|
| | Minimum | Optimaler Bereich | |
| Char-Lynn-Motoren mit Axialverteilterventil | 70 SUS 13 cSt | 100-200 SUS 20-43 cSt | 18/13 |
| | | | |

Zusätzliche Anmerkungen:

- Zu dickflüssige Druckflüssigkeiten verursachen bei Kaltwetter-Starts Pumpen-Kavitation und mögliche Folgeschäden. Motor-Kavitation bei Kaltwetter-Starts ist mit Ausnahme der 2-Gang Motoren kein Problem. Dickflüssiges Öl kann hohe Gehäusedrücke verursachen, die während der Betriebszeit die Wellendichtringe herausdrücken.
- Bei der Auswahl der hydraulischen Druckflüssigkeit müssen alle System-Komponenten berücksichtigt und ein entsprechender optimaler Viskositätsbereich festgelegt werden. Wenn z.B. eine Medium Duty Kolbenpumpe mit einem Geroler-Motor kombiniert wird, beträgt der optimale Viskositätsbereich 100-150 SUS [20-32 cSt] und die Viskosität sollte niemals unter den Wert von 70 SUS [15 cSt] fallen.
- Falls die natürliche Farbe der Druckflüssigkeit in schwarz übergeht, ist möglicherweise ein Überhitzungsproblem vorhanden.
- Falls die Druckflüssigkeit milchig wird, könnte eine Wasser-Verunreinigung vorhanden sein.
- Lesen Sie den Druckflüssigkeitsstand in kaltem Zustand ab.
