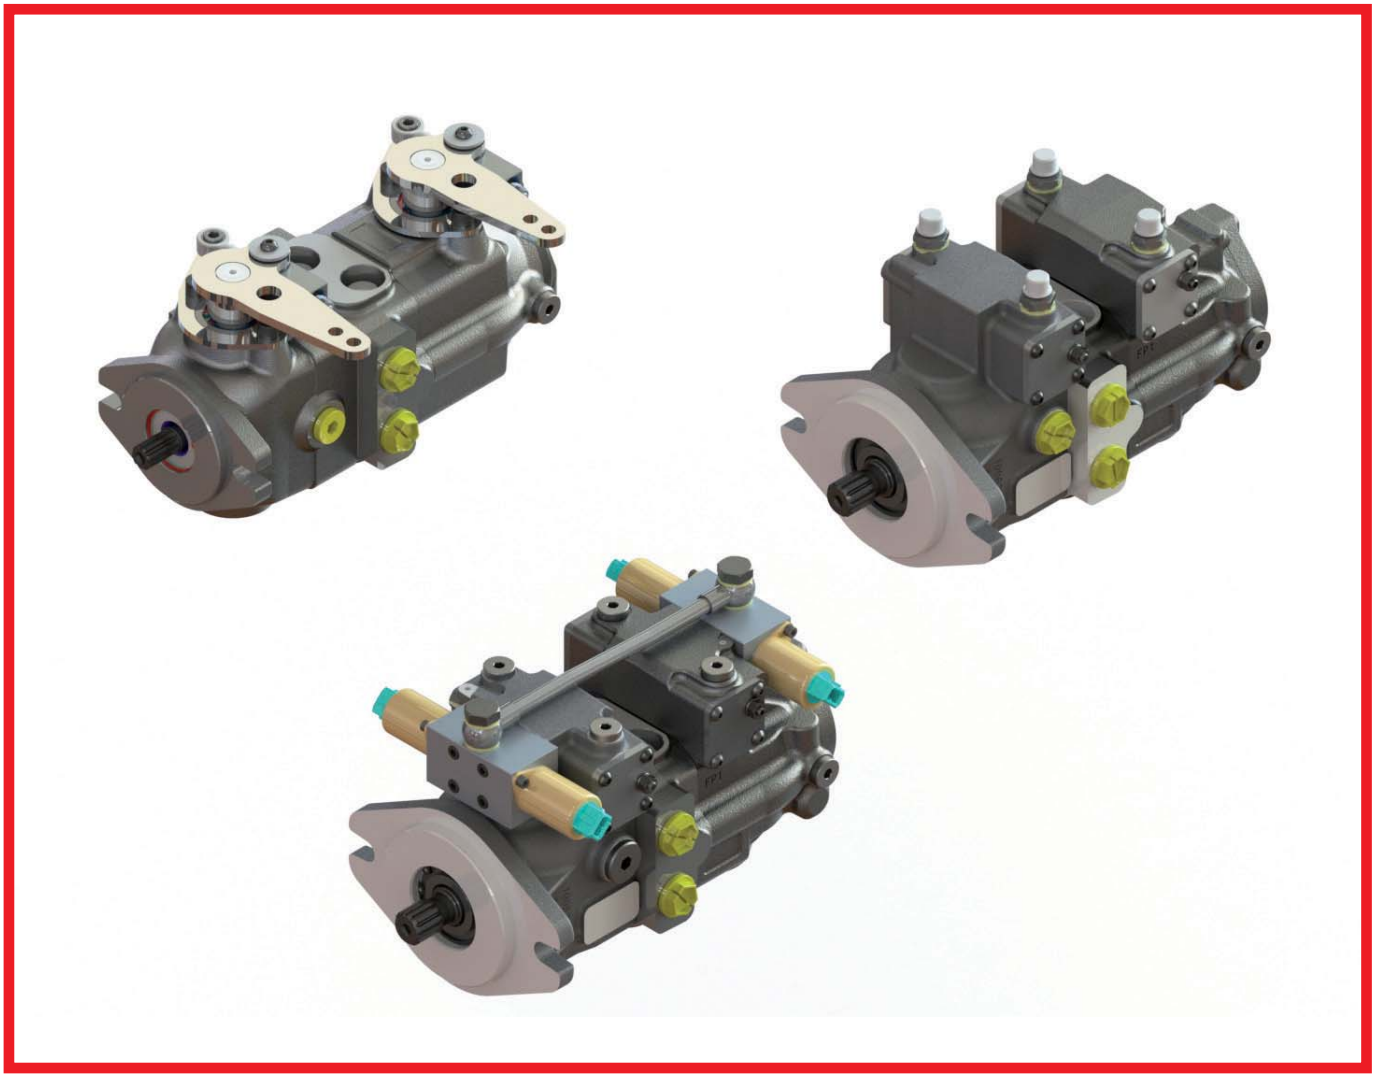
Variable Displacement Closed Loop System
Axial Piston Compact Tandem Pump

TPV 1200 BTB



INDEX

GENERAL INFORMATION

- TPV 1200 BTB is a variable displacement, compact tandem axial piston pump, with swashplate system, for closed loop hydrostatic transmissions.

- Flow rate is proportional to the rotation speed and displacement, and is continuously variable.
  It increases as the swashplate angle moves from “0” to maximum position.
  If the swashplate is positioned beyond the neutral point, the flow rate respectively follows one of the two directions.

- The TPV 1200 BTB is equipped with a boost pump, “gerotor” type of new design and high efficiency to keep the circuit pressurised, to compensate the oil leakages of the hydrostatic transmission, to avoid cavitation of the piston pump and to supply low pressure oil flow to the remote controls of the pumps and of the hydraulic transmission (max 3 MPa).

- The standard version is of mechanical type on which, by means of a lever, the change of flow in the two directions is obtained.

- This series of pumps can be with a hydraulic servo control or electro-proportional control which allows the control of the pump by means of hydraulic or electric joysticks.

- Moreover the pump is fitted with relief valves and it is adapted for assembly of auxiliary gear pumps.

- The compact tandem TPV 1200 BTB, are available with splined or parallel shaft and can be supplied with options such as purge valve, screw by-pass valve and, for security, "man on board" valve.

- The piston pumps are to be considered as individual components for the purposes of Directive 98/37/EC, therefore have been built to be integrated into a circuit or to be assembled with other components to form a machine or system. They can be operated only after they have been installed in the machine/system which they are intended for.

- The TPV 1200 BTB pumps must be used to create, manage and regulate oil flow in a closed loop system. Any other use should be considered improper.

- The pumps are built according to the technology normally used for this type of product. There is the risk of injury or damage to personnel during their installation and use if you do not respect the normal safety instructions or if used by untrained personnel.

TECHNICAL SPECIFICATIONS

The housing and the distributor cover of the pumps TPV 1200 are made in cast iron.
The flow rate is proportional to the rotation speed and the displacement is continuously variable. It increases as the swash-plate angle moves from "0" to maximum position.
If the swash-plate is positioned out of the neutral position, the flow respectively follows one of the two directions.

Typical applications

- construction equipment
- green mowers
- zero turn machines
- agricultural machines
- utility vehicles
- forest vehicles
- logistic machines

PUMP MODEL		TPV 6-7	TPV 8-7	TPV 9-7	TPV 11-7	TPV 12-7	TPV 13-7	TPV 15-9	TPV 17-9	TPV 18-9	TPV 19-9	TPV 21-9

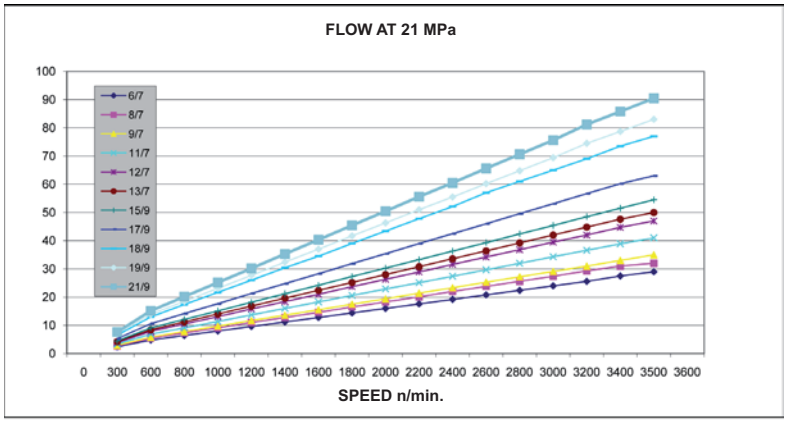
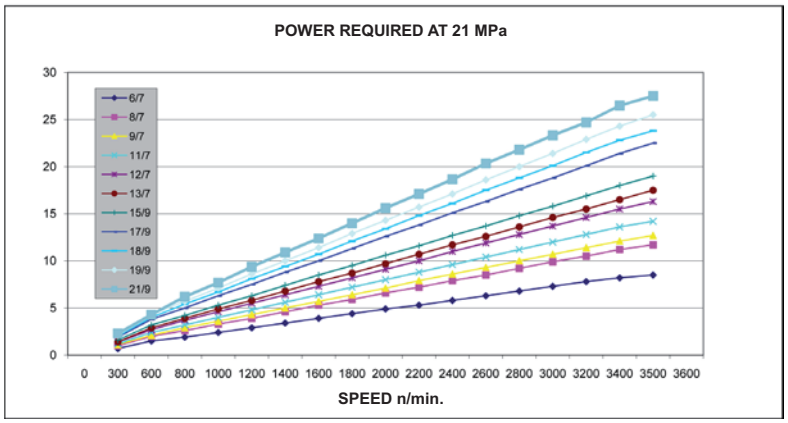
(2) 1.000 n/min
(3) Indicative vaues, weight varies depending on configuration and optionals

SYSTEM DESIGN PARAMETERS

HYDRAULIC MEASURE	USEFUL FORMULAS	CONVERSION FACTORS
Flow rate: Q = (l/min)	**Q** = $V\ [cm^3/n] \times \eta_v \times n \times 10^{-3}$	1 l/min = 0,2641 US Gal/min
Pressure: P = (MPa)		1 MPa = 145 PSI
Displacement: V = (cm^3/n)		
Torque: M = (Nm)	**M** = $\frac{\Delta p\ [MPa] \times V\ [cm^3/n]}{6.283 \times \eta_m}$	1 Nm = 8,851 in lbs
Power: P = (kW)	**P** = $\frac{\Delta p\ [MPa] \times V\ [cm^3/n] \times n}{60 \times 1000 \times \eta_t}$	1 KW = 1,36 HP
Shaft speed: n = n/min		
Hydraulic efficiency: = Ηv		
Mechanical efficiency: = Ηm		
Overall efficiency: = Ηt		
		1 mm = 0,0394 in
		1 kg = 2,205 lbs
		1 N = 0,2248 lbs

PERFORMANCE DIAGRAM





Performance diagrams

- The diagrams show the data of maximum speed and maximum continues pressure.
- Data may vary depending on pump displacement.

Pressure

- Continuous pressure: is the average pressure for continuous work, which must not be exceeded, to ensure a correct and long lasting service of the pump.
- Maximum pressure: is the maximum allowable pressure for short periods and must never be exceeded.

Speed

- Continuous work speed: is the maximum recommended speed for continuous operation of the pump under full load.
- Maximum speed: is the maximum permissible speed for the pump for short periods and not fully loaded. The use of the pump with this speed can reduce the life cause a loss of power or hydrostatic braking capacity.

Caution

Any damage caused to the pump can reduce or eliminate the hydrostatic braking capacity. It is therefore necessary to provide an auxiliary braking system capable of stopping and supporting the weight of the complete machine, in the event of loss of hydrostatic power.

INSTALLATION INSTRUCTIONS

Standards for the installation, start up and maintenance

- When mounting the pump above the minimum level of the tank, distance of the highest point of the pump over the oil level MUST NOT exceed 250 mm.

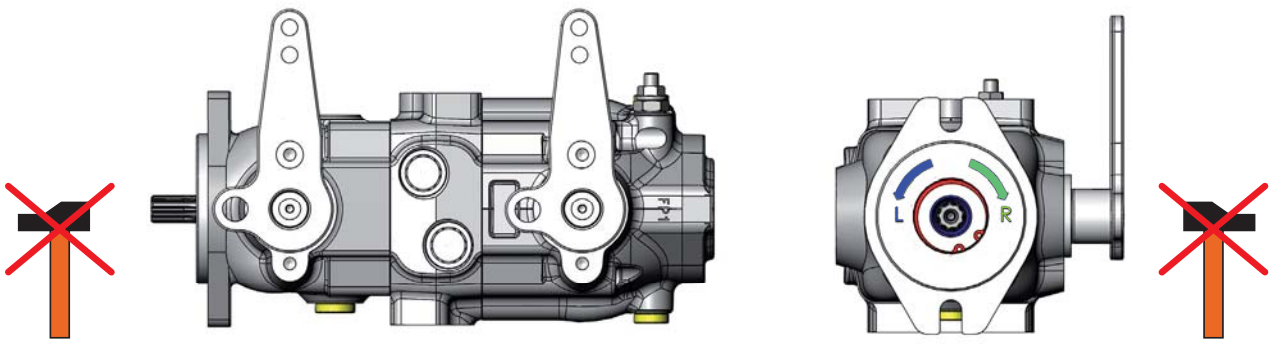
- To reduce the noise level typical of all piston pumps we recommend:
  - use hoses instead of pipes
  - limit to a minimum the length of eventual pipes
  - fix rigid pipe sections with special supports equipped with rubber vibration dampening devices
  - use pipes and hoses with a diameter according to the speed values below:

    Suction line = 0,6 ÷ 1,2 m / s
    Drain = 1,5 ÷ 3,6 m / s
    Pressurized lines = max 6 m / s

- To calculate the speed of the oil in the lines refer to the formula below:

    V = Q * 21,22 / D
    V = speed (m/s)
    Q = flow rate (l/min)
  D = internal pipe/hose diameter (mm)

- In any case NEVER use pipes/hoses or fittings with diameter smaller than that of the corresponding ports on the pump. This indication is ABSOLUTELY OBLIGATORY for the drain line to avoid to pressurize the pump housing and extrude the lip seal of the pump shaft.
- During mounting cure the alignment of the pump, concentric with the drive shaft sleeve to prevent overloading of the bearing.
- For the hydraulic system, we recommend using pipes/hoses washed internally with hydraulic oil or, even better, with solvent.
- Special care must be taken when cleaning the inside of the tank (painting is recommended after sand blasting).
- To improve the functionality of the boost pump, it is recommended to place it below minimum tank level.
- The pumps can be installed in any direction and position.
  For further information contact our Technical Department.

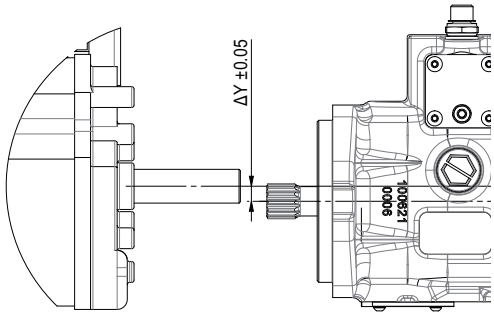


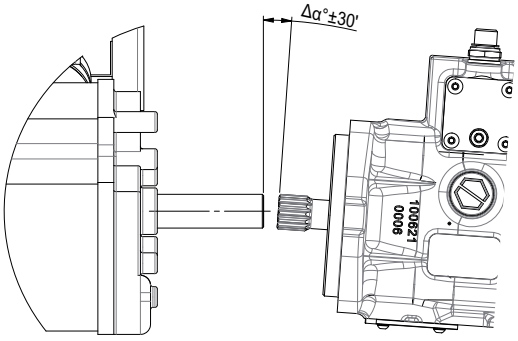
(continued)

INSTALLATION INSTRUCTIONS

Shaft Coupling

To connect the pump shaft to the engine flywheel or prime motor shaft use a flexible





coupling. The alignment must be within the tolerances indicated in the figures below.
For an optimal function of the pump the shaft should not be subjected to radial or axial loads. In the presence of radial and axial loads the maximum allowable values are shown below.
During the installation or removal, do not force the coupling of the pump shaft, but always use the threaded hole on the shaft.

Start up

- Before starting fill the tank and the other components with new filtered oil. You should run a flushing of the complete hydraulic system (see Use and Maintenance Manual). Check that the low pressure value is correct (refer to the Use and Maintenance Manual).
- Restore the oil level in the tank.

Maintenance

- The first oil change should be made after 500 hours of operation. Later change the oil every 2000 hours.
- The first replacement of the filter cartridge has to be made after 50 hours for a preliminary circuit cleaning. Then after further 500 hours.
- These frequencies have to be reduced in the case where the indicator shows the clogging of the filter cartridge and in case of operation in environments with a high level of contamination.

CAUTION

- Always work with the utmost attention to the moving parts; do not use loose or fluttering clothing.
- Do not approach rotating wheels, tracks, chains or shafts if not properly protected, or when they may start moving without notice.
- Do not loosen or disconnect fittings and pipes/hoses while the engine is running.
- Avoid oil leaks in order to prevent environmental pollution.

Load capacity of rear shaft (through drive shaft)

- The rear shaft is not able to carry radial loads.

HYDRAULIC FLUID

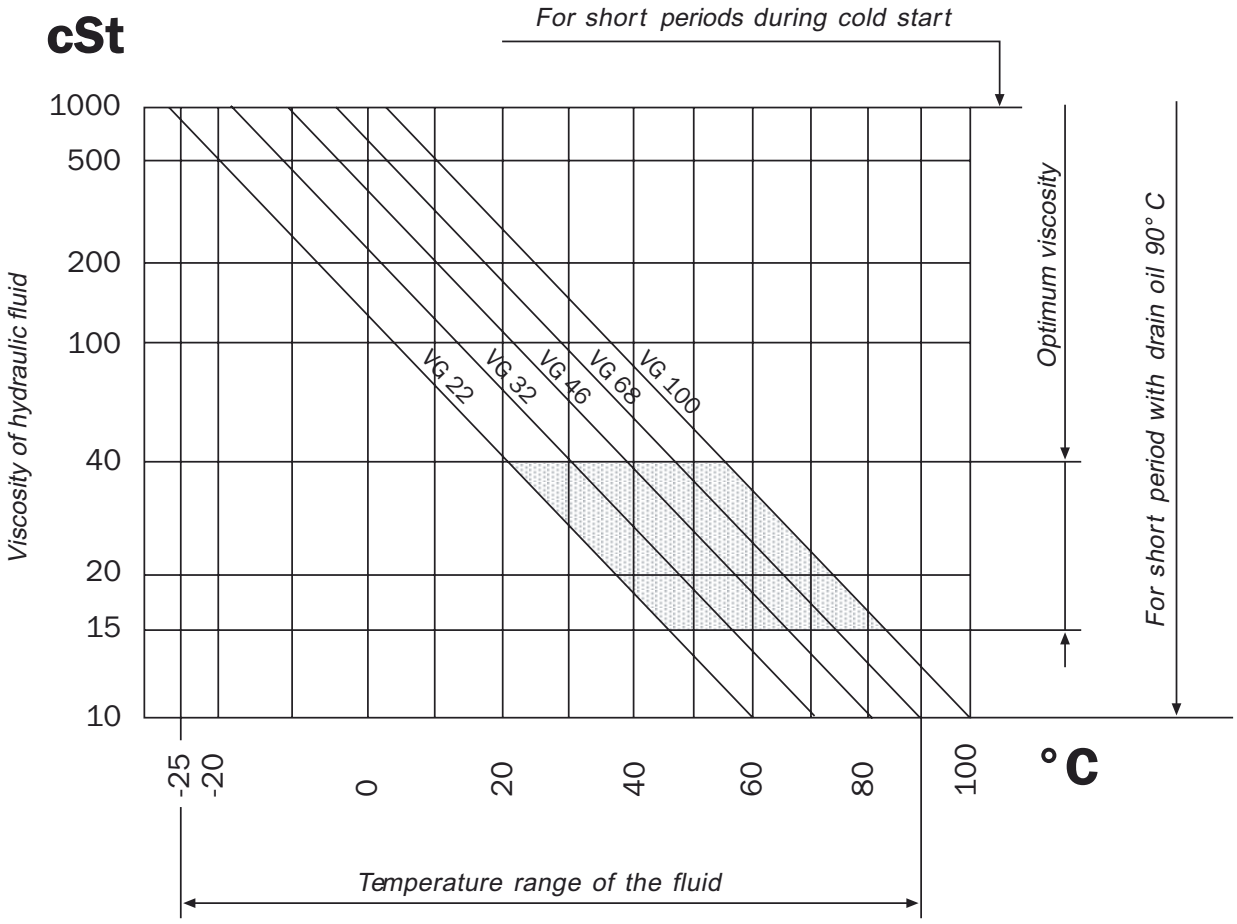
Viscosity

The maximum duration and the maximum efficiency are related to the optimum range of viscosity.
Viscosity = optimal operating viscosity 15 ÷ 40 cSt referred to the temperature of the closed circuit.

Minimum viscosity = 10 cSt for short moments and with the maximum temperature of the drain oil at 90 °C.
Max. viscosity = 1000 cSt for a few seconds, only during cold starting.

Working conditions

For working conditions apply the following limits:



HANSA - TMP cannot be held responsible concerning non compliance of these instructions and observance of safety regulations, although not covered by this document.

HYDRAULIC FLUID FILTRATION

The contaminating particles suspended in the hydraulic fluid cause the wear of the hydraulic mechanisms moving parts.
On hydraulic pumps these parts operate with very small dimensional tolerances.
In order to prolong the parts life, it is recommended to use a filter that maintains the hydraulic fluid contamination class at max.

8 according to NAS 1638
5 according to SAE, ASTM, AIA
19/17/14 according to ISO 4406

According to the type of application decided for the pump, it is necessary to use filtration elements with a filtration ratio of:

$$ß_{(X)}\ 20 \div 30 \geq 75$$

making sure that this ratio does not worsen together with the increasing of the filter cartridge differential pressure. While the pump is working, its temperature increases (over 80° to 110°C) with negative effects on pump performances; as a consequence, it is important to observe a max. contamination level of:

7 according to NAS 1638
4 according to SAE, ASTM, AIA
18/16/13 according to ISO 4406

If these values cannot be secured, the component life will consequently be reduced and it is recommended to contact our Tech. Dept.

Suction filters

The suction filters will have a clogging indicator and bypass. The max. pressure drop of the filtration element must not exceed 0,04 absolute MPa (0,08 absolute MPa with cold start).

Filter assembling

The suction filter is mounted in the suction line. Check that the pressure before the boost pump is 0,8 absolute bar, measured on the pump suction port (0,05 MPa for cold starting).

DIRECT MECHANICAL CONTROL

The change of pump displacement is given by clockwise or conter clockwise rotation of the drive pin of the oscillating plate.

The drive pin is directly linked with the oscillating plate.

CONTROL LEVER WITH RETURN TO ZERO POSITION

(torsion spring)

The pump displacement variation is obtained by rotating the lever in a clockwise or counter-clockwise direction.
Return to zero is obtained trough a spring integrated in the lever shaft.

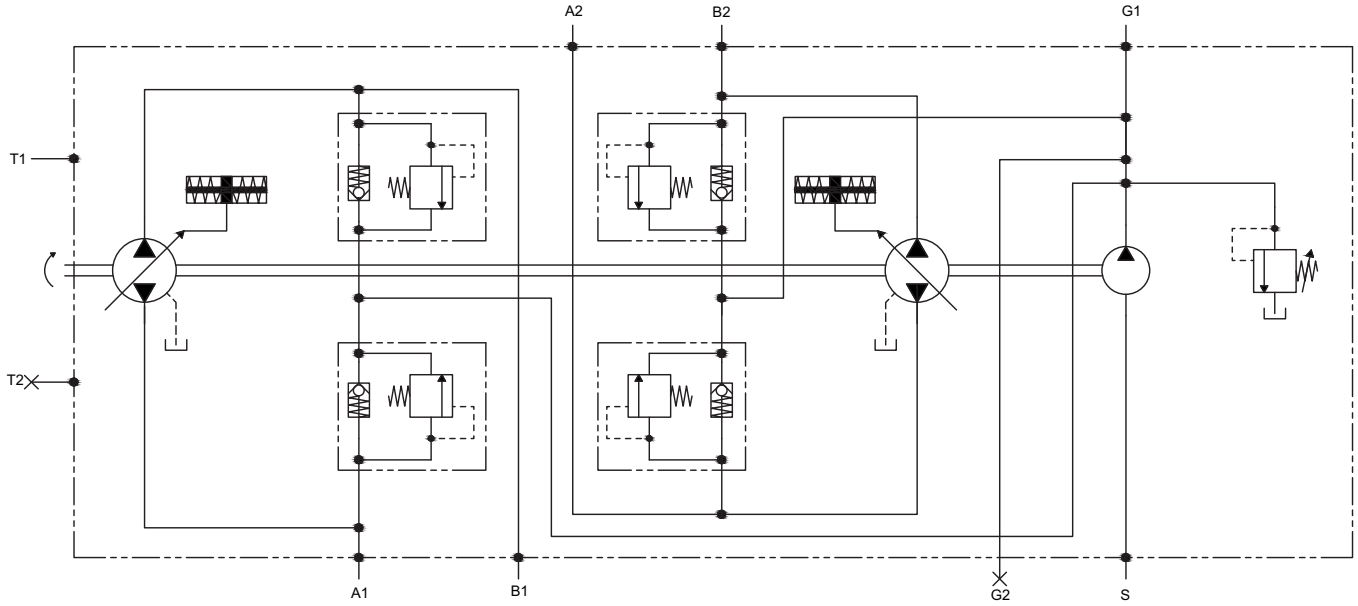
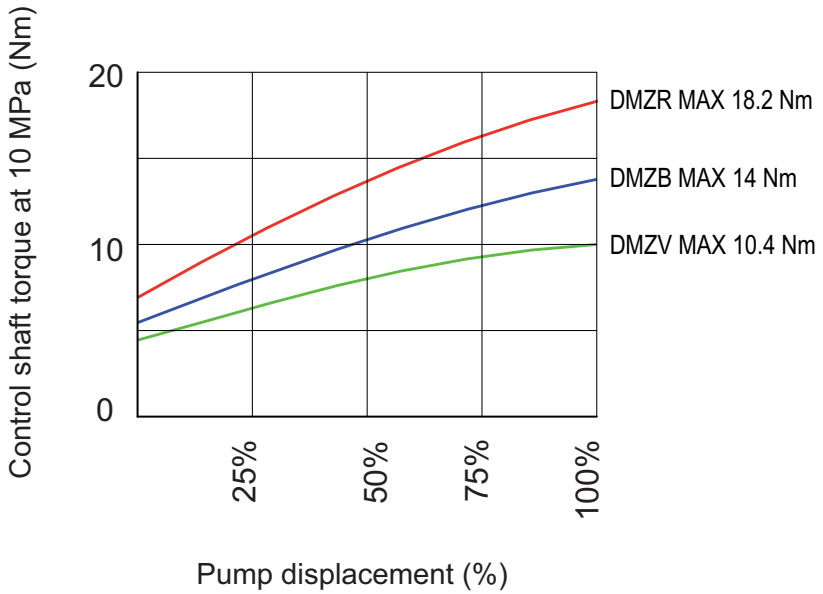
HYDRAULIC DIAGRAM





SHI

INTEGRATED REMOTE HYDRAULIC SERVO CONTROL

The pump displacement variation is obtained by adjusting the pressure on P1, P2, P3 and P4 servo control ports by means of a hydraulic proportional joystick (with integrated pressure reducing valves).
The servo control supply can be obtained by taking pressure from the boost pump (G1- G2 ports), see pag. 17.
The servo control return time can be adjusted by inserting a restrictor on the joystick supply line (0, 5 ÷ 1,2 mm).
The servo control operation curve, in both directions, goes from 0,4 to 1,8 MPa (tolerance (± 5 %).
The adjusting curve of the hydraulic joystick has to be a little wider (0,3 ÷ 1,9 MPa).
Suggested curves for HPV series Joysticks: CR062 (see HT 73/B/105/0417/E catalogue).

Max. torque = 70 Nm

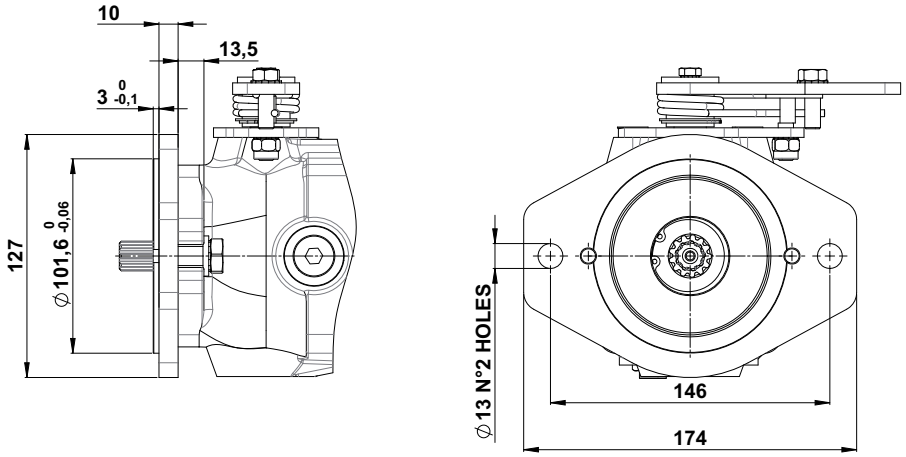
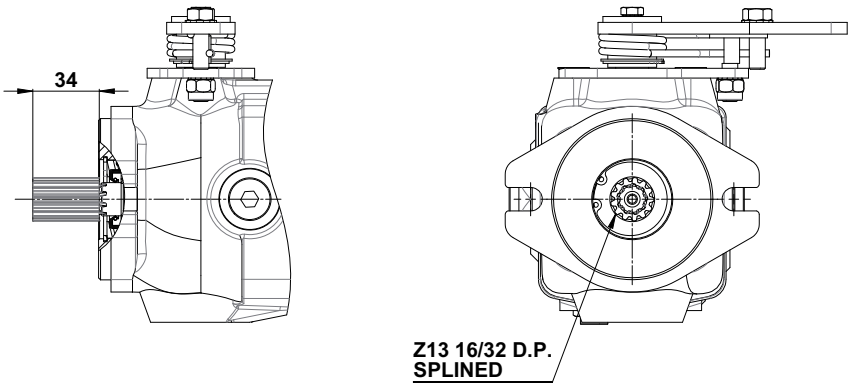
OPTIONAL FB

ADAPTOR FLANGE FROM SAE A - SAE B



OPTIONAL ST

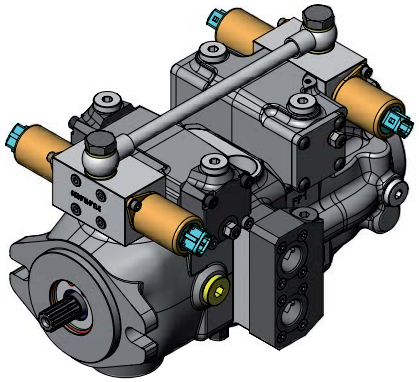
ADAPTOR COUPLING Z=9 / Z=13 - 16/32" DP

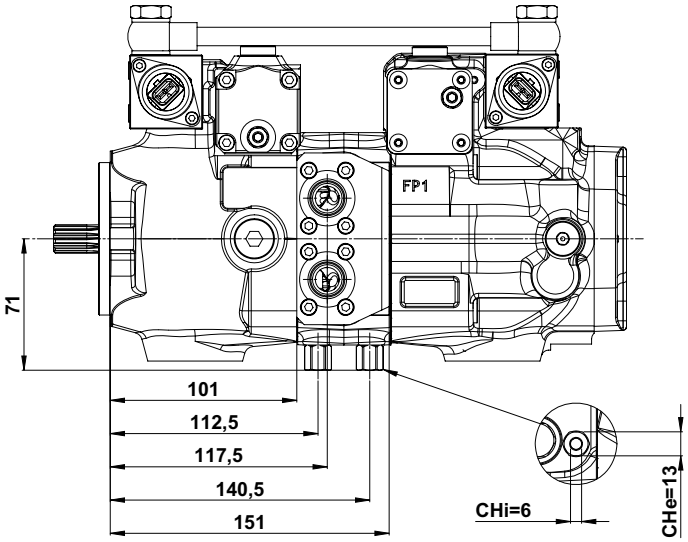


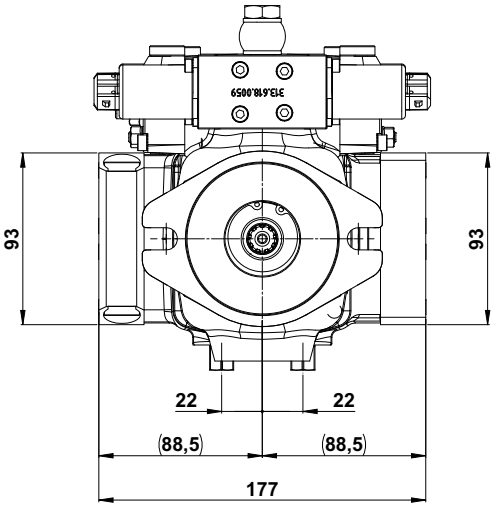
OPTIONAL VS-SB

PURGE VALVE WITH SCREW BY-PASS

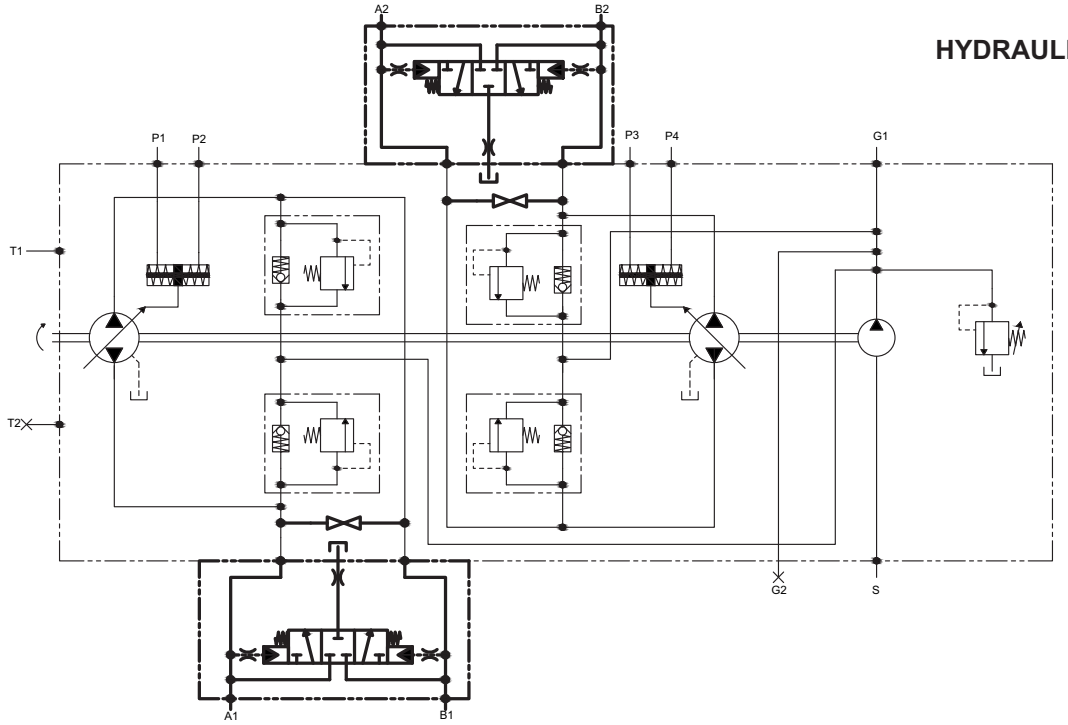
The TPV 1200 BTB pumps are available with purge valve (loop flushing) with screw by-pass.
The valve consists of a spring centered shuttle spool connecting automatically the low pressure line (boost) with the reservoir removing heat from the system. The quantity of the flushing oil is a function of the low system pressure (boost) and the size of the orifice on the valve (different orifices are available referred to the system pressure). The spool shifts at a differential pressure of about 0,8 MPa (116 PSI).







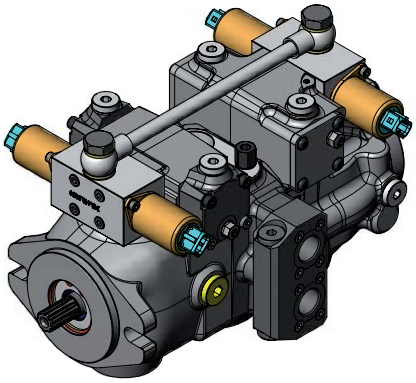
HYDRAULIC DIAGRAM

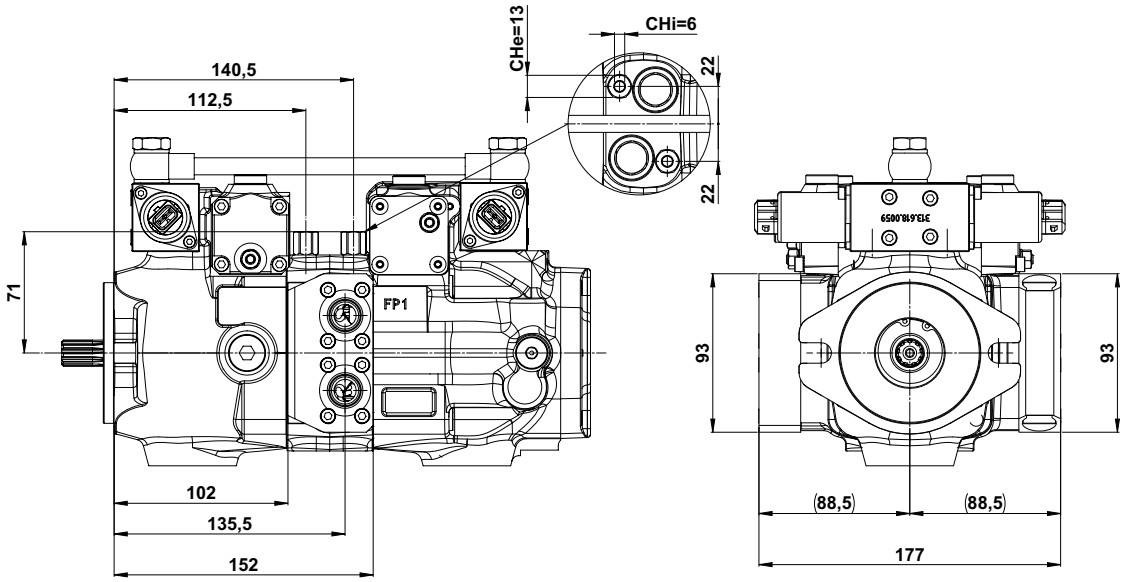


OPTIONAL VS-SB1

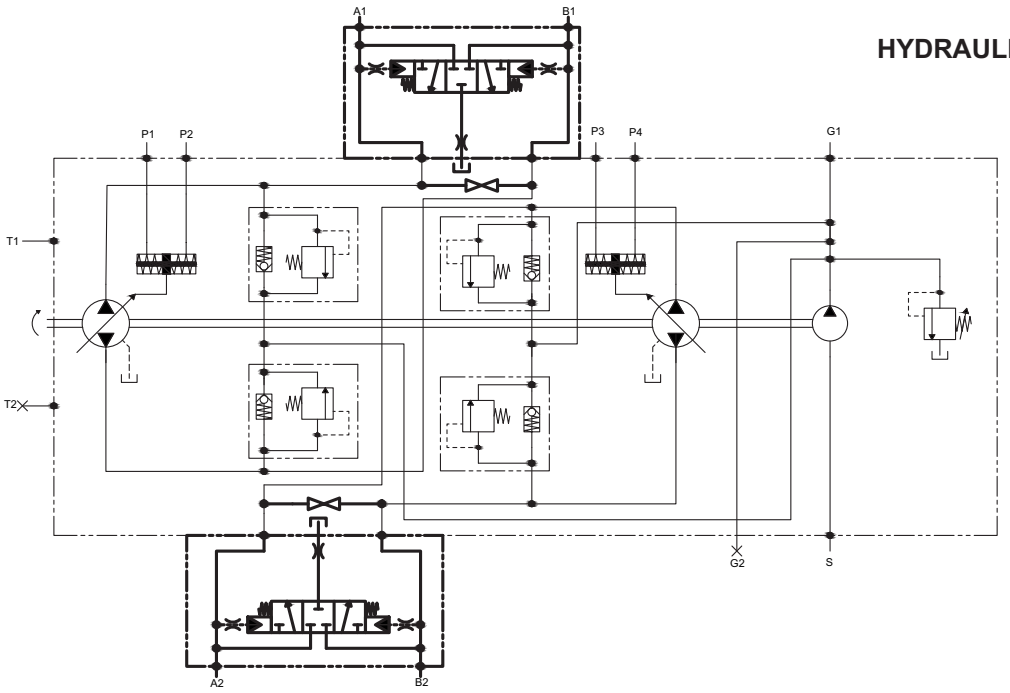
PURGE VALVE WITH SCREW BY-PASS (180° rotated position)

The TPV 1200 BTB pumps are available with purge valve (loop flushing) with screw by-pass in 180° rotated position.
The valve consists of a spring centered shuttle spool connecting automatically the low pressure line (boost) with the reservoir removing heat from the system. The quantity of the flushing oil is a function of the low system pressure (boost) and the size of the orifice on the valve (different orifices are available referred to the system pressure). The spool shifts at a differential pressure of about 0,8 MPa (116 PSI).





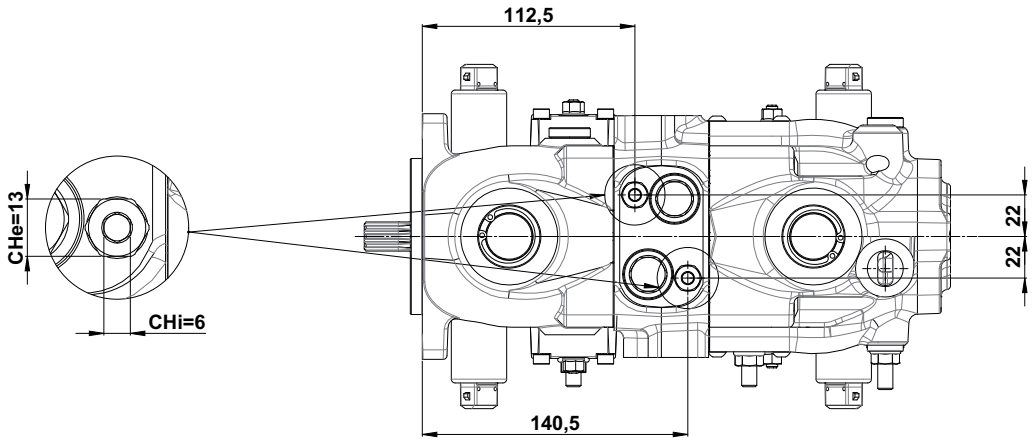
HYDRAULIC DIAGRAM

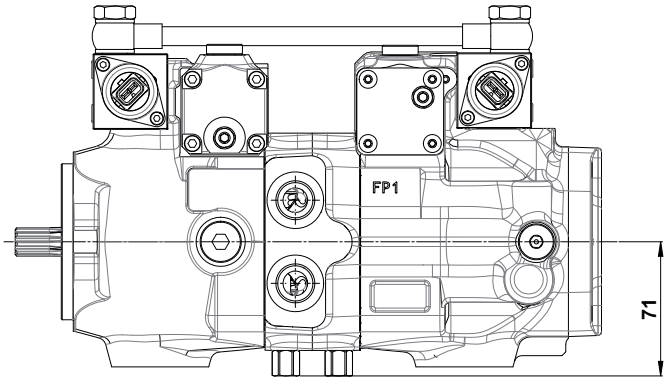


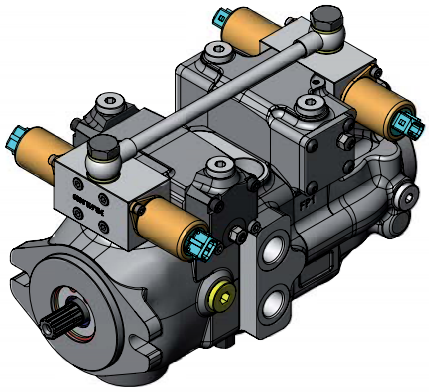
OPTIONAL SB

SCREW BY- PASS

To by pass the oil flow from one direction to the other, with the pump not running or in emergency condition a by pass screw can be actuated to connect the 2 lines of the hydraulic system. The orifice is completely open after 4 counter-clockwise rotations of the screw.





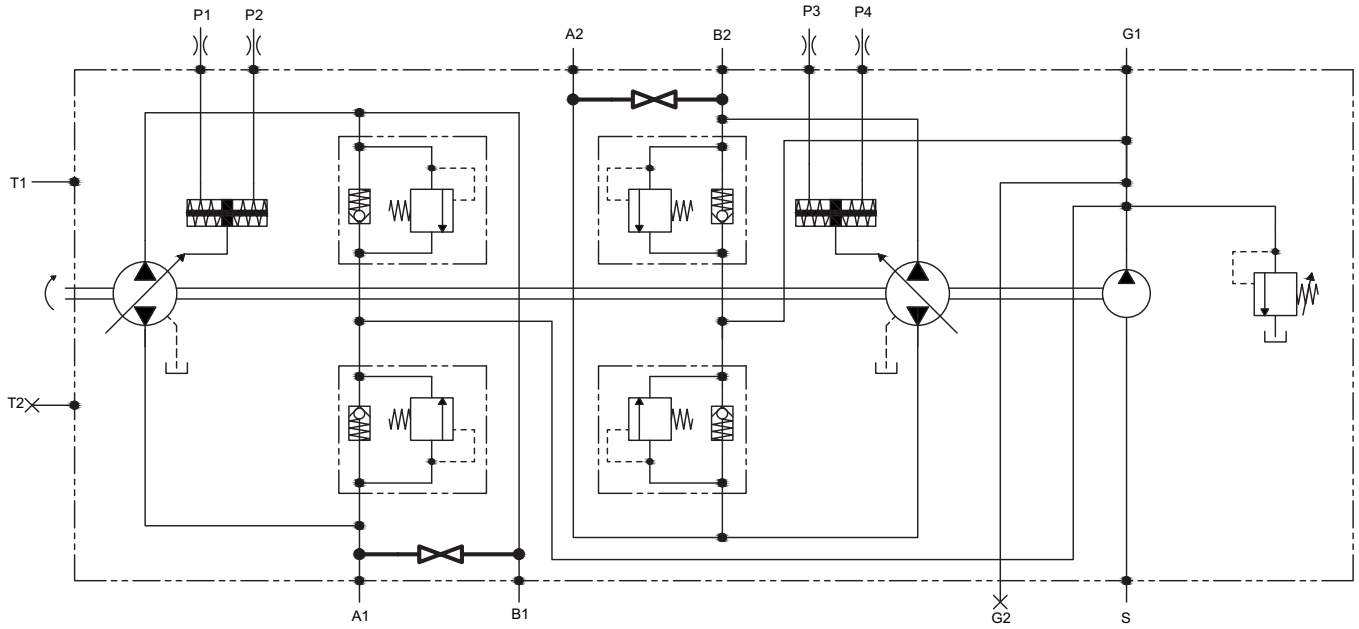


(continued)

OPTIONAL SB

SCREW BY- PASS

HYDRAULIC DIAGRAM



OPTIONAL SB1

SCREW BY-PASS (180° rotated position)

To by pass the oil flow from one direction to the other, with the pump not running or in emergency condition a by pass screw can be actuated to connect the 2 lines of the hydraulic system. The orifice is completely open after 4 counter-clockwise rotations of the screw.

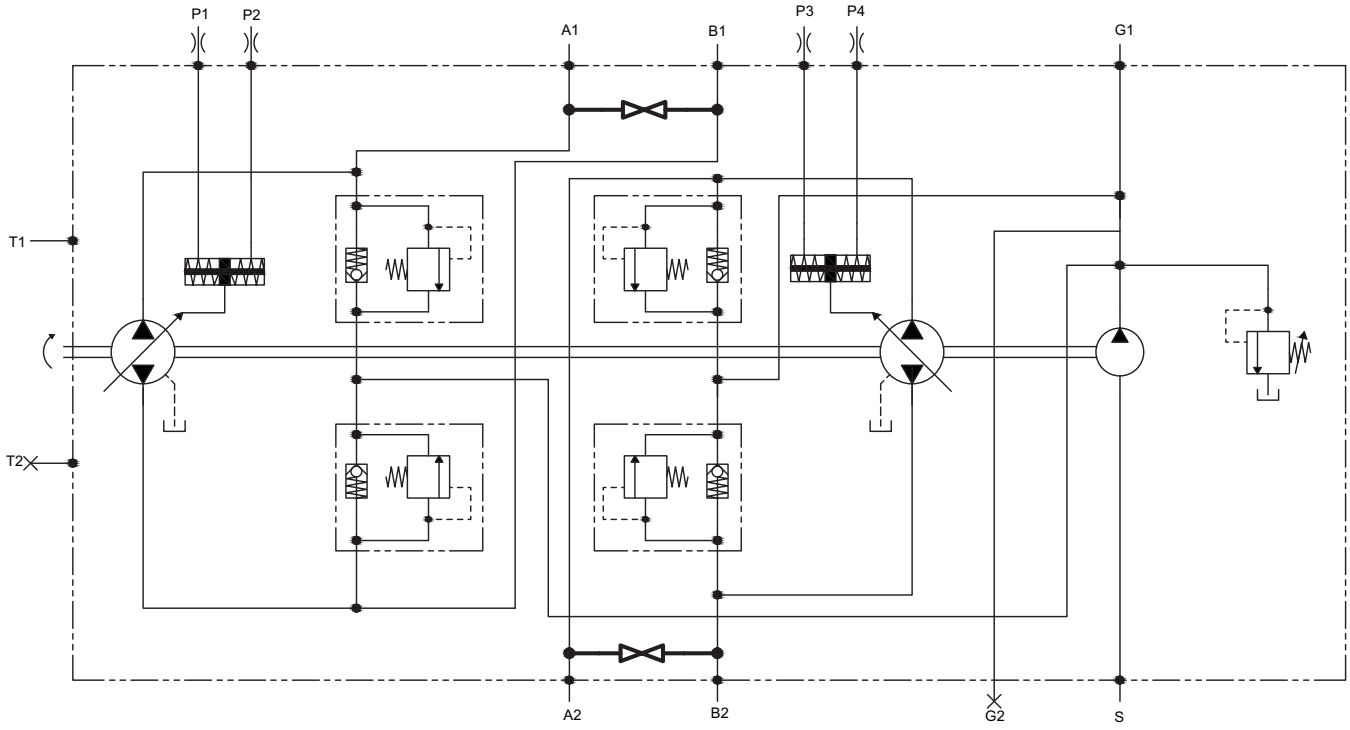
OPTIONAL SB1

SCREW BY-PASS (180° rotated position)

HYDRAULIC DIAGRAM



OPTIONAL MOB

MAN ON BOARD

A normally open solenoid valve cuts the oil flow when not activated.
The valve allows oil flow to feed the hydraulic system only if activated (the operator is seated).
The solenoid valve is available for 12V or 24V DC voltage.

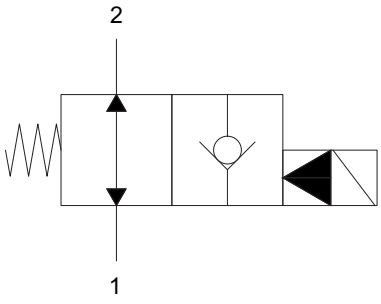
OPTIONAL MOB

MAN ON BOARD

TECHNICAL FEATURES

VALVE MOB - Hydraulic characteristics	
Max. operating pressure	30 MPa
Max. flow	40 lt/min.
Internal leakage	max. 5 drops/min. at 30 MPa
Response time	energized 20 ms
De-energized	30 ms
Temperature range	from -20°C to 90°C

VALVE MOB - Electrical characteristics	
Power	18 W
Various voltage options available	(AC/DC)
Wire insulation	Class H
Duty factor	ED 100%
Supply power tolerance	+ 10%, - 15% (DC)
Ambient temperature	from -30°C to 60°C
Several connection options available	



TROUBLE SHOOTING

TROUBLES	CAUSE	REMEDY
High noise level	Too high rotation speed of the pump.	Reduce pump rotation speed.
	Wrong rotation direction.	Check the rotation direction of the pump.
	Obstruction in suction line - air in the suction line - wrong oil viscosity - diameter of suction line too small.	Check oil type and viscosity. Check internal diameter of suction line. Remove restrictions. Check oil level of reservoir. Eliminate air intake.
	Not correct connection of the pump. Not correct diameter of pipes / hoses.	Check the pump connections and the pipe / hose diameters according to notes.
	Vibrations of relief valves .	Check the inlet suction line - Check and replace relief valves.
	Internal parts worn out.	Check and replace.
	Wrong pump connection to the prime mover.	Check connections and rotation of direction.
	Too low rotation speed of the pump.	Increase the pump rotation speed.
Low flow rate	Obstructions in the suction line - wrong viscosity.	Check oil type and viscosity. Check internal diameter of suction line. Remove restrictions. Check oil level of reservoir. Eliminate air intake.
	Low remote control pressure.	Check and adjust.
	High internal leakage.	Check the case drain flow.
	Low rotation speed of the pump.	Increase speed of the pump.
Instable or low pressure	Obstruction of suction line - air in the suction line - wrong oil viscosity - diameter of suction line too small.	Check oil type and viscosity. Check internal diameter of suction line. Remove restrictions. Check oil level of reservoir. Eliminate air intake.
	Vibration of relief valves.	Check the inlet suction line. Check and replace relief valves.
	Internal parts worn out.	Check and replace.
Over heating	High oil temperature at suction inlet.	Check the cooling system.
	Internal parts worn out.	Check - replace.
	Wrong setting of pressure relief valves.	Check - adjust the setting of relief valves.
